# Introduction

This report is comprised of a few chapters. Chapter 1 declares the main framework we will follow for penetration testing and the strategies used for gaining access to the system. Chapter 2 reports detailed steps in texts and screenshots of each strategies and its results. Chapter 3 demonstrates steps for obtaining the flags in the Metasploitable system and cracking passwords of Super Users. In Chapter 4, we will discuss our conclusions of the assignment.

## Chapter 1: Design

Since we know that the system exists (with provided IP address) and some minimal information (Metasploitable), we assumed that this exercise is the first level – “External attacker with no knowledge of the system” (1, p. 828). Our goal for this penetration test is to gain access to the target system and to collect secret information (four flags), username and password of SuperUsers.

Here are our design plan adapted from Bishop (1, p.830) and Kenedy et al. (2, p.3):

1. **Intelligence gathering:** We will run scans of the targeted system to collect more information about it, such as ports, protocols, OS, services and their versions. In this assignment we will use Nmap because we have familiarized ourselves with it during the Assignment 1. This step is the crucial for all strategies (2, p. 18).
2. **Hypothesis:** We will use information collected from the scan results to identify vulnerabilities and to plan for different approaches. We will research the vulnerabilities through various sources such as books, blog posts and exploit database. Each approach will be reported with details in Chapter 2. Our potential approaches are:
  - a. Finding a vulnerable services that can help enabling us to initiate a backdoor
  - b. Finding vulnerable services that allow us to execute remote arbitrary commands to gain access to the system
3. **Exploitation:** Testing the approaches on Armitage to see if the vulnerabilities can be exploited
4. **Post Exploitation:** During this phase, by interacting with the target system through Shell, we will try to escalate privilege if we have not during the previous phase. With Super User privileges, we will explore the system and find as many flags as possible. We will also look into etc/shadow where the hashes values of passwords located, and use John the Ripper to find these passwords.

## Chapter 2: Experiment results

### 1. Intelligence gathering

In Kali Linux terminal, we ran several scans with different options, one of them was `sudo nmap -sS -sV -A -oN our target 10.11.203.107` to know more about TCP connection, service version detection, operating system detection and version detection on the IP address of our target. We specified `-A` for a more detailed and comprehensive result, `-sS` for a stealthier and less likely to be detected by the system, and `-sV` to determine the versions of services (3).

```

1 # Nmap 7.94 scan initiated Sun Dec 10 15:18:13 2023 as: nmap -sS -sV -A -oN nmap0612.txt 10.11.203.107

Figure 1: One of our nmap scan results

## 2. Hypothesis – Exploitation

### Strategy 1: Vsftpd 2.3.4 backdoor

After scanning the system, Nmap showed us that TCP port 21 uses the vsftpd 2.3.4 service. This is a known vulnerability for UNIX operating systems in the “Exploit Database” (7). It can be used for exploiting through backdoor. Our hypothesis is that we can exploit our target using this exploit.

On Armitage, we used the exploit `unix/ftp/vsftpd_234_backdoor` with RHOSTS as `10.11.203.107` and successfully initiated a backdoor, resulting an interacting Shell on the target. With this exploitation, we directly gained root access on the target, so there was no need for a privilege escalation step. Using the command window, we could be able to explore all files and directory in the target system, which helped us obtain all the flags in Chapter 3 and read the `etc/shadow` file.

```

msf6 exploit(unix/ftp/vsftpd_234_backdoor) >

```

Figure 2: Using vsftpd 2.3.4 backdoor

## Strategy 2: Samba usernamemap\_script

Nmap also showed that the target was using Samba version 3.0.20, which is vulnerable to remote arbitrary commands with root privileges (4).

On Armitage, we searched for exploit multi/samba/usermap\_script and with this exploit, we successfully gained a shell on the target with root privilege. Similarly to Strategy 1, we could obtain all flags and shadow file.

Figure 3: Using Samba usernamemap\_script exploit to gain root access

## Strategy 3: DistCC\_exec

This strategy came up after another scan with `nmap -Pn -n -p- 10.11.203.107` to see if we missed something in previous scans. And we could see that the port 3632 was open and running distccd service.

```
1 # Nmap 7.94 scan initiated Sun Dec 10 16:38:26 2023 as: nmap -Pn -n -p- -oN nmap0712.txt 10.11.203.107

29 8180/tcp  open  unknown
30 8787/tcp  open  msgsrvr
```

Figure 4: Nmap scan reveal distccd

Then, we tried the exploit `unix/misc/distcc_exec` on Armitage and gained a Shell as user `daemon`. We are aware that a privilege escalation has to be performed at this point. However, due to the limited time and instruction to not modify the system, we decided to not go for privilege escalation. During our exploitation, using the command `uname -a`, we discovered this server was running an old version of Linux kernel (2.6.24). This version is vulnerable to exploit such as DirtyCow (6) which would allow us to escalate privilege if we were allowed to download and execute code to the system and modify the access control.

With `daemon` privilege, we were able to access the `etc` folder and open all the files that contain our flags (`SuperSecretInformation`, `.HiddenSecretInformation`, `motd` and `passwd`). However, `daemon` cannot read `etc/shadow`. Therefore, with this strategy we could obtain all flags, but not the passwords.

Figure 5: Gaining Shell as `daemon`

## Chapter 3: Capture the flags

After locating to `etc` folder, we used the command `ls -lsa` to see information detailed information about each file and directory, including permissions, number of links, owner, group, size, and the timestamp of the last modification, and especially the file with “.” in front of it. We immediately spot the files `SuperSecretInformation` and `.HiddenSecretInformation`.

### Flag 1

The file `SuperSecretInformation` contains the following information:

```
$ cat SuperSecretInformation
Rot13

Wrfcre'f snibhevgr guvatf va gur jbeyq vf Jvaqbjf naq erq jvar
$
```

Figure 6: Inside `SuperSecretInformation` file

We recognized that the message was encrypted with monoalphabetic rotation cipher with rotation of 13. Using simple Python script, we were able to decipher the text as follow:

Jesper's favourite things in the world is Windows and red wine

```
def decipher_rotate_cipher(text, shift):
    result = ""
    for i in range(len(text)):
        char = text[i]
        if char.isupper():
            result += chr((ord(char) - shift - 65) % 26 + 65)
        elif char.islower():
            result += chr((ord(char) - shift - 97) % 26 + 97)
        else:
            result += char
    return result

encrypted_text = "Wrfc're'f snibhevgr guvatf va gur jbeyq vf Jvaqbjf naq erq jvar"
shift = 13

decrypted_text = decipher_rotate_cipher(encrypted_text, shift)
print("Encrypted text: ", encrypted_text)
print("Decrypted text: ", decrypted_text)
```

✓ 0.0s

Encrypted text: Wrfc're'f snibhevgr guvatf va gur jbeyq vf Jvaqbjf naq erq jvar  
Decrypted text: Jesper's favourite things in the world is Windows and red wine

Figure 7: Decipher the message

## Flag 2

In the file `.HiddenSecretInformation` we found the following message in clear:

Ulf has sailed all of the seven seas

```
$ cat .HiddenSecretInformation
Ulf has sailed all of the seven seas
$
```

Figure 8: Inside `.HiddenSecretInformation` file

## Flag 3

Following the instruction, we used the code `cat /etc/motd` to open the file.

We observed a long text hinted that there is a secret message hidden in plain text, we assumed that this is some kind of steganography.

```
Others might have said that you need encryption to protect a secret
Later, or now, you might see that this may not be true
Demented as i am, i hide without a code, visible to you

Glass, thin as glass, transparent, visible, yet blurry
Rodents! stealing my secrets? no, they will stay hidden, so don't be in a hurry
Away from the public eye
Very secret, yes, search low and high
Every day, every night, i dread the day when it comes out
You, my dear reader, will you be the one
And find my secret, try, it will be fun.
Read again, and read in a new way
Definitely, let your eyes to the left sway.
```

Figure 9: Some hints from the message

We took hint from last line of the text and try take the first characters of each line, and then we got the following message:

NOD BUILDING IS BUILT ON AN OLD GRAVEYARD

## Flag 4

We used `cat /etc/passwd` to open the file `passwd`. This file is supposed to contain usernames, encrypted passwords, user ID, group ID, name of users, user home directory and login shell (8). However, upon careful inspection, the last line of the file does not look like others, because it contains a message:

Eric is afraid of frogs

```
mysql:x:109:118:MySQL Server,,,:/var/lib/mysql:/bin/false
tomcat55:x:110:65534::/usr/share/tomcat5.5:/bin/false
distccd:x:111:65534:::/bin/false
user:x:1001:1001:just a user,111,,:/home/user:/bin/bash
service:x:1002:1002:::/home/service:/bin/bash
telnetd:x:112:120::/nonexistent:/bin/false
proftpd:x:113:65534::/var/run/proftpd:/bin/false
statd:x:114:65534::/var/lib/nfs:/bin/false
robert:x:1003:1003::/home/robert:/bin/sh
eric:x:1004:1004:Eric is afraid of frogs:/home/eric:/bin/sh
```

Figure 10: Secret message in `passwd` file

```
cat /etc/shadow > acc_pass
```

## Chapter 4: Cracking the passwords

With root privilege we can easily access the `etc/shadow` that other normal users cannot. We then copy the content into a txt file in our Kali machine, called `acc_pass`.

In a command shell, we run `sudo john -incremental acc_pass` with the aim of trying a brute force attack (5). After some time, we stopped the command and only achieved seven out of nine passwords.

```
(cs2lab@kali)-[~]
$ john --show acc_pass
sys:batman:14742:0:99999:7:::
klog:123456789:14742:0:99999:7:::
msfadmin:easy:19687:0:99999:7:::
postgres:postgres:14685:0:99999:7:::
user:user:14699:0:99999:7:::
service:service:14715:0:99999:7:::
eric:eric:19687:0:99999:7:::

7 password hashes cracked, 2 left
```

Figure 11: First brute force attack

Among these seven cracked passwords, **msfadmin** is a SuperUser, highlighted with red text by john. We also tested usernames and passwords obtained from john with `ssh_login` on Armitage to check if they are valid.

We tried running john again with the last two hashes of user `root` and `robert` in a file called `acc_pass2`. Brute force might take a long time to crack all passwords, since it tries every possible combination. Therefore, we decided to change our strategy to dictionary attack (5). During investigating our Kali VM, we found that a zipped `rockyou.txt` wordlist at this location: `/usr/share/wordlists/rockyou.txt.gz` in our VM. Therefore we unzip this `rockyou.txt` and used it for our dictionary attack with `sudo john -w=rockyou.txt acc_pass2`.

After some more time, we achieved the last two passwords, and one of them is a SuperUser – **root**.

```

(cs2lab@kali)-[~]
$ sudo john --w=rockyou.txt acc_pass2
Warning: detected hash type "md5crypt", but the string is also recognized as "md5crypt-long"
Use the "--format=md5crypt-long" option to force loading these as that type instead
Using default input encoding: UTF-8
Loaded 2 password hashes with 2 different salts (md5crypt, crypt(3) $1$ (and variants) [MD5 5
12/512 AVX512BW 16x3])
Will run 2 OpenMP threads
Press 'q' or Ctrl-C to abort, almost any other key for status
unknown          (robert)
HelpMe           (root)
2g 0:00:00:55 DONE (2023-12-08 19:38) 0.03627g/s 197682p/s 197738c/s 197738C/s Henry113..Hellokitty1972
Use the "--show" option to display all of the cracked passwords reliably
Session completed.

```

Figure 12: Dictionary attack with rockyou wordlist

In the end, we successfully cracked all the passwords, with msfadmin and root as super users.

## Conclusion

With this assignment, we gained a deeper insight into various aspects of cybersecurity, such as:

- Through this penetration test, we understood different stages of an attack, from initial information gathering to gaining access and potentially to privilege escalation.
- When learning how to take advantage of the vulnerabilities, we could see how a minor misconfigurations or outdated software can lead to a serious security breach. Therefore, we understand more why regular updates are crucial for security.
- In hindsight, there are many different ways to gain access into a system, but some vulnerabilities are more serious than others. For example, with `distccd` vulnerability, we only gained access as normal user, and it could have taken more work to escalate privilege; while with `vsftpd` backdoor, we gained root access right away.
